kanuleader@gmail.com

EDUCATION

Kyungpook National University, South Korea

March 2008 - August 2014

B.S. in Electronics Engineering

KAIST, South Korea

September 2014 - August 2016

M.S. in Electrical Engineering

CAREER OBJECTIVE

Building AI solutions to meet our needs.

PROJECTS

Face detection in surveillance system

In video surveillance system, the exposure of a persons face is a serious threat to personal privacy. To protect the personal privacy in large amount of videos, an automatic face detection method is required to locate and mask the persons face.

Low light image enhancement' technology on sensor ISP

Sensor image quality deteriorates due to noise in low-light environments. To solve this problem, an algorithm for improving image quality using multi-frames has been proposed.

Dual camera solution on sensor ISP

Image synthesis technology using heterogeneous dual cameras has been developed.

Deep learning based segmentation solution on mobile devices

Deep learning-based segmentation was developed and applied to maximize the bokeh effect in portrait mode.

Deep learning based image recovery solution to achieve yield improvements from a to z

As the pixels of the sensor become finer, the production yield decreases. Accordingly, a deep learning-based image restoration algorithm is developed to bring dead pixels to life.

TECHNICAL STRENGTHS

Languages	C, C++, Python, Matlab
Technologies	Latex
Tools	Tensorflow, Tensorflow Lite, Pytorch, Caffe
Accelerator	GPU, NPU, XNNPACK, NNAPI, Hexagon DSPs
Version Control	Github

WORK EXPERIENCE

Samsung Electronics Internship Program, South Korea

January 2015 - January 2015

Intern

- During this period, I learned about sensor imaging processing techniques.

Samsung Electronics, South Korea

August 2016 - Present

Engineer

- The content below covers only stories related to deep learning and computer vision in my career.

- Face detection and tracking algorithms were used to design systems that automatically detect human faces in surveillance environments. In particular, deep learning-based facial recognition algorithms were ported to the C level and integrated into the system.
- As part of the application of the 2PD sensor, a Bokeh solution was developed by fusion of segmentation technology and the depth map using phase information. Segmentation was designed from Deeplab segmentaion. Quantization aware training additionally was used to highly optimize the architecture in mobile environment.
- On mobile, image recovery solution to defect data has been developed, and released to industrial field. I have been leading as a practical engineer to provide AI based solution including all need development process: Finding points where deep learning technology can be applied, defining the problem statements, creating a scenario for the overall system using SOTA technology in deep learning, and build optimized system using tensorflow lite and accelerator in mobile environment.

ACHIEVEMENTS

National Science and Engineering Undergraduate Scholarship *March 2008 - February 2014*
