EDUCATION

KAIST, South Korea

M.S. in Electrical Engineering

September 2014 - August 2016

Kyungpook National University, South Korea

B.S. in Electronics Engineering

March 2008 - August 2014

CAREER OBJECTIVE

Building AI solutions to meet our needs. And I believe that the plausible methodology itself is meaningless if it is not possible to implement what was thought.

PROJECTS

Deep learning based image recovery solution to achieve yield improvements from a to z

As the pixels of the sensor become finer, the production yield decreases. Accordingly, a deep learning-based image restoration algorithm was developed to bring dead pixels to life.

Deep learning based segmentation solution on mobile devices

Deep learning-based segmentation was developed and applied to get more bokeh effect in portrait mode.

Dual camera solution on sensor ISP

Image synthesis technology using heterogeneous dual cameras was developed.

Low light image enhancement technology on sensor ISP

Noise in low-light environments is a major cause of sensor image quality degradation. In order to improve the image quality deterioration, multi-frame image denoising was applied.

Face detection in large-scale surveillance system

In video surveillance system, the exposure of a persons face is a serious threat to personal privacy. To protect the personal privacy in large amount of videos, an automatic face detection method is required to locate and mask the persons face.

TECHNICAL STRENGTHS

Languages	C, C++, Python, Matlab
Technologies	Latex
Tools	Tensorflow, Tensorflow Lite, Pytorch, Caffe
Accelerators	GPU, XNNPACK, NNAPI
Version Control	Github, Docker Hub

WORK EXPERIENCE

Samsung Electronics, South Korea

Engineer

August 2016 - Present

- As part of the application of the dual photodiode sensor, a bokeh solution was developed by fusion of segmentation technology and the depth map using phase information. The architecture of segmentation was designed from the previously proposed Deeplab. And an attempt was made to apply the quantization aware training methodology to highly optimize the architecture.

- Image recovery solution to defect data has been developed, and released to industrial field. The following process was involved in commercializing AI solutions for the first time as a practical engineer: find points where deep learning technology can be applied, define problem statements, create scenarios for the entire system using SOTA technology in deep learning, and build optimized systems using tensorflow lite and accelerators in a mobile environment. This is the first case of mass production to apply self-developed deep learning technology.

Samsung Electronics Internship Program, South Korea

January 2015 - January 2015

Intern

- It was time to understand the overall flow of image processing methods that are essential for mobile image sensors.

KAIST, South Korea

September 2014 - August 2016

M.S Candidate

- Face detection and tracking algorithms were used to design systems that automatically detect human faces in surveillance environments. In particular, deep learning-based face detector was ported to the C level and integrated into the system for privacy protection in large-scale surveillance video.

ACHIEVEMENTS

National Science and Engineering Undergraduate Scholarship

March 2008 - February 2014
