EDUCATION

KAIST, South Korea

M.S. in Electrical Engineering

September 2014 - August 2016

Kyungpook National University, South Korea

B.S. in Electronics Engineering

March 2008 - August 2014

CAREER OBJECTIVE

Building AI solutions to meet our needs. And I believe that the plausible methodology itself is meaningless if it is not possible to implement what was thought.

PROJECTS

Deep learning based image recovery solution to achieve yield improvements

As the pixels of the sensor become finer, the production yield decreases. Accordingly, a deep learning-based image restoration algorithm was developed to bring dead pixels to life.

Deep learning based segmentation solution on mobile devices

Deep learning-based segmentation was developed and applied to get more bokeh effect in portrait mode.

Dual camera solution on sensor ISP

Image synthesis technology using heterogeneous dual cameras was developed.

Low light image enhancement technology on sensor ISP

Noise in low-light environments is a major cause of sensor image quality degradation. In order to improve the image quality deterioration, multi-frame image denoising was applied.

Face detection in large-scale surveillance system

In video surveillance system, the exposure of a person's face is a serious threat to personal privacy. To protect the personal privacy in large amount of videos, an automatic face detection method is required to locate and mask the person's face.

TECHNICAL STRENGTHS

Languages	C, C++, Python, Matlab
Technologies	Latex
Tools	Tensorflow, Tensorflow Lite, Pytorch, Caffe
Accelerators	GPU, XNNPACK, NNAPI
Version Control	Github, Docker Hub

WORK EXPERIENCE

Samsung Electronics, South Korea(January 2015 - Present)

> System LSI division > Sensor product development team

December 2020 - Present

AI Software Engineer

- Image recovery solution to defect data has been developed, and released to industrial field. The following process was involved in commercializing AI solutions for the first time as a practical engineer: find points where deep learning technology can be applied, define problem statements, create scenarios for the entire system using SOTA technology in deep learning, and build optimized systems using tensorflow lite and

accelerators in a mobile environment. This is the first case of mass production to apply self-developed deep learning technology.

> System LSI division > Multimedia development team December 2018 - December 2020
AI Software Engineer

- As part of the application of the dual photodiode sensor, a bokeh solution was developed by fusion of segmentation technology and the depth map using phase information. The architecture of segmentation was designed from the previously proposed Deeplab. In addition, deeplabv3 uses MobileNet as its backbone, resulting in a lightweight deep neural network. It significantly reduces the number of parameters when compared to networks with regular convolutions with the same depth in the network. And an attempt was made to apply the quantization aware training(QAT) methodology to highly optimize the architecture.
- With the prosperity of deep learning, there was a movement to replace the existing remosaic algorithm to deep learning methods. It is a converter to bayer from image sensor overlaid with non-bayer CFA.
- In order to develop our own deep learning technology, we started with the development environment configuration for the first time. We have configured and deployed a Docker environment that can be used to train deep learning models using multiple GPUs in a Linux environment. We also created a simple mobile-oriented prototype to construct the entire development scenario.

> System LSI division > Sensor product development team August 2016 - December 2018
Engineer

- We developed a dual camera fusion algorithm using wide and tele. For this fusion algorithm to work, it must be assumed that two input images are registered.
- The sensor image suffers from image quality degradation due to noise in a low-light environment. To alleviate this, we designed a multi-frame-based denoising algorithm by matching multiple images.

Samsung Electronics Internship Program January 2015 - January 2015
Intern

- It was time to understand the overall flow of image processing methods that are essential for mobile image sensors.

ACHIEVEMENTS

National Science and Engineering Undergraduate Scholarship March 2008 - February 2014
